Group Tango

Institute of Web Science and Technologies

Department of Computer Science

University of Koblenz-Landau

Submission until: November 2, 2016, 10:00 a.m.

Tutorial on: November 4th, 2016, 12:00 p.m.

The main objective of this assignment is for you to use different tools with which you can understand the network that you are connected to or you are connecting to in a better sense. These tasks are not always specific to “Introduction to Web Science”. For all the assignment questions that require you to write a code, make sure to include the code in the answer sheet, along with a separate python file. Where screen shots are required, please add them in the answers directly and not as separate files.

## 1 Ethernet Frame (5 Points)

Ethernet Frame is of the given structure:

Preamble	Destination MAC address	Source MAC address	Type/Length	User Data	Frame Check Sequence (FCS)
8	6	6	2	46 - 1500	4

**Figure 1:** Ethernet Frame Structure

Given below is an Ethernet frame without the Preamble and the Frame Check Sequence.

```
00 27 10 21 fa 48 00 13    10 e8 dd 52 08 06 00 01
08 00 06 04 00 01 00 13    10 e8 dd 52 c0 a8 02 01
00 00 00 00 00 00 c0 a8    02 67
```

Find:

1. Source MAC Address
2. Destination MAC Address
3. What protocol is inside the data payload?
4. Please mention what the last 2 fields hold in the above frame.

Solution:

1. Source MAC Address: 00:13:10:e8:dd:52
2. Destination MAC Address: 00:27:10:21:fa:48
3. Protocol: Address Resolution Protocol
4. The last two blocks of the targets contain IP Address (192.168.2.103).

## 2 Cable Issue (5 Points)

Let us consider we have two cables of 20 meters each. One of them is in a 100MBps network while the other is in a 10MBps network. If you had to transfer data through each of them, how much time it would take for the first bit to arrive in each setting? (For your calculation you can assume that the speed of light takes the same value as in the videos.) Please provide formulas and calculations along with your results.

Solution:

Let  $c$  be the speed of light,  $l$  the length of the cable and  $t$  the time it takes for the first bit to travel the length  $l$ . As the length of the cables are equal and the networks bandwidth doesn't change the propagation delay, the calculation for both networks are the same. Given the speed of light  $c = 3 \cdot 10^8 \frac{m}{s}$  and the formula for the propagation delay  $t = \frac{l}{c}$ , the propagation delay is  $t = \frac{20}{3 \cdot 10^8} s \approx 67 ns$

### 3 Basic Network Tools (10 Points)

Listed below are some of the commands which you need to "google" to understand what they stand for:

1. *ipconfig* / *ifconfig*
2. *ping*
3. *tracert*
4. *arp*
5. *dig*

Consider a situation in which you need to check if [www.wikipedia.org](http://www.wikipedia.org) is reachable or not. Using the knowledge you gained above to find the following information:

1. The *% packet loss* if at all it happened after sending 100 packets.
2. *Size* of the packet sent to *Wikipedia* server
3. *IP address* of your machine and the *Wikipedia* server
4. *Query Time* for DNS query of the above url.
5. Number of *Hops* in between your machine and the server
6. MAC address of the device that is acting as your network gateway.

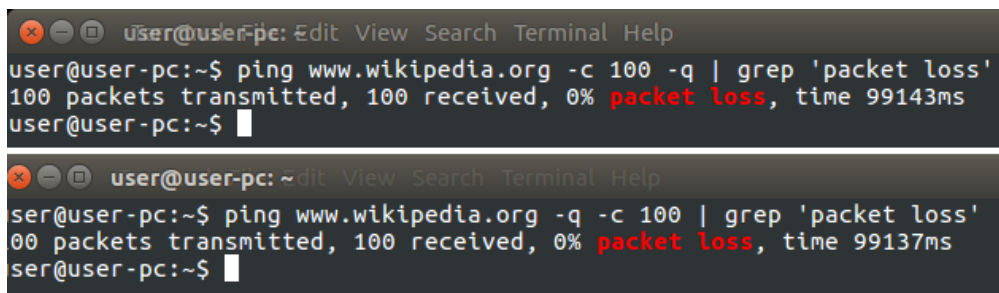

Do this once in the university and once in your home/dormitory network. With your answers, you must paste the screen shots to validate your find.

Solution:

1. The *% packet loss* if at all it happened after sending 100 packets.

**Command:** `ping www.wikipedia.org -q -c 100 | grep 'packet loss'`

**Result:** Packet loss = 0 in both cases.

```
user@user-pc:~$ ping www.wikipedia.org -q -c 100 | grep 'packet loss'
100 packets transmitted, 100 received, 0% packet loss, time 99143ms
user@user-pc:~$
```

```
ser@user-pc:~$ ping www.wikipedia.org -q -c 100 | grep 'packet loss'
00 packets transmitted, 100 received, 0% packet loss, time 99137ms
ser@user-pc:~$
```

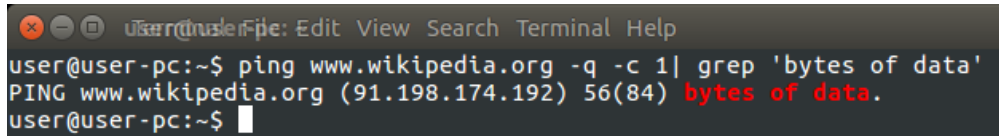

Figure 2: 100 packets ping

2. *Size* of the packet sent to *Wikipedia* server

**Command:** `ping www.wikipedia.org -q -c 1 | grep 'bytes of data'`

**Result:** Size of the packet = 56 bytes in both cases.

84 bytes Ping Bytes Sent = 56 bytes Ping Packet Size + Ping Header Packet Size (28 bytes). May be changed with flag -s for ping command.

```
user@user-pc:~$ ping www.wikipedia.org -q -c 1 | grep 'bytes of data'
PING www.wikipedia.org (91.198.174.192) 56(84) bytes of data.
user@user-pc:~$
```

**Figure 3:** Packet size

3. *IP address* of your machine and the *Wikipedia* server

**Command:**

Server IP: `ping www.wikipedia.org -q -c 1 | grep 'PING www.wikipedia.org'`

Local IP: `ip addr show wlan0 | grep 'inet'`

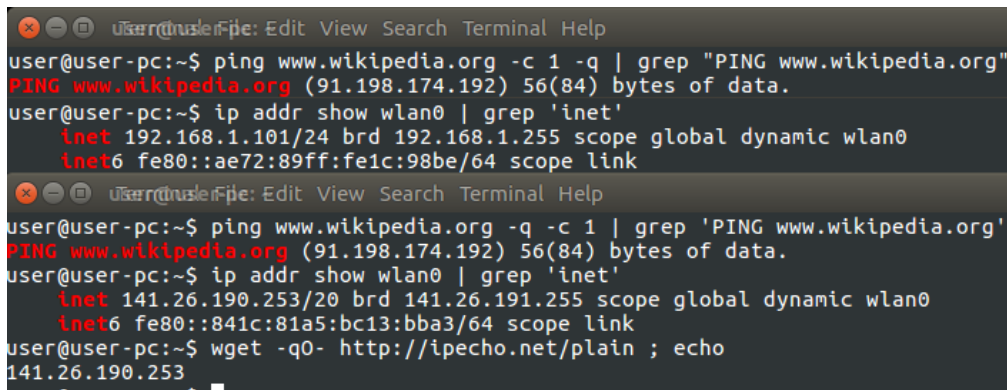

External IP: `wget -qO- http://ipecho.net/plain ; echo`

**Result:**

wikipedia server IP = 91.198.174.192;

home local IP = 192.168.1.101; home external IP = 94.242.228.97;

university local IP = 141.26.190.253; university external IP = 141.26.190.253.

```
user@user-pc:~$ ping www.wikipedia.org -c 1 -q | grep "PING www.wikipedia.org"
PING www.wikipedia.org (91.198.174.192) 56(84) bytes of data.
user@user-pc:~$ ip addr show wlan0 | grep 'inet'
    inet 192.168.1.101/24 brd 192.168.1.255 scope global dynamic wlan0
    inet6 fe80::ae72:89ff:fe1c:98be/64 scope link
user@user-pc:~$ ping www.wikipedia.org -q -c 1 | grep 'PING www.wikipedia.org'
PING www.wikipedia.org (91.198.174.192) 56(84) bytes of data.
user@user-pc:~$ ip addr show wlan0 | grep 'inet'
    inet 141.26.190.253/20 brd 141.26.191.255 scope global dynamic wlan0
    inet6 fe80::841c:81a5:bc13:bba3/64 scope link
user@user-pc:~$ wget -qO- http://ipecho.net/plain ; echo
141.26.190.253
```

**Figure 4:** Server and PC addresses

4. *Query Time* for DNS query of the above url.

**Command:** `dig www.wikipedia.org | grep "Query time:"`

**Result:** University Query time = 1 msec; Home Query time = 30 msec.

5. Number of *Hops* in between your machine and the server

**Command:** `tracert -I www.wikipedia.org`

**Result:** University - 11 hops; Home - 9 hops.

```
user@user-pc: ~  
user@user-pc:~$ dig www.wikipedia.org | grep "Query time:"  
;; Query time: 30 msec  
user@user-pc:~$  
user@user-pc:~$ dig www.wikipedia.org | grep "Query time:"  
;; Query time: 1 msec  
user@user-pc:~$
```

Figure 5: Query time

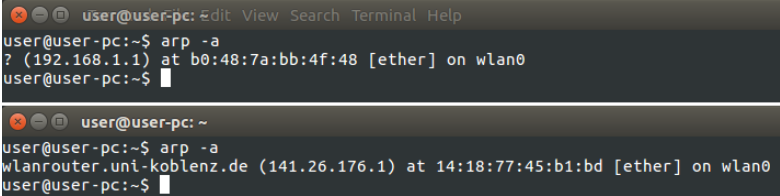

```
root@user-pc:~$ sudo -i  
[sudo] password for user:  
root@user-pc:~# traceroute -I www.wikipedia.org  
traceroute to www.wikipedia.org (91.198.174.192), 30 hops max, 60 byte packets

Figure 6: Trace route

6. MAC address of the device that is acting as your network gateway.

**Command:** `arp -a`

**Result:** For university = 14:18:77:45:b1:bd ; for home network = b0:48:7a:bb:4f:48.

The figure consists of two terminal window screenshots. The top window shows the command `arp -a` being executed, resulting in the output: `? (192.168.1.1) at b0:48:7a:bb:4f:48 [ether] on wlan0`. The bottom window shows the same command `arp -a` being executed, resulting in the output: `wlanrouter.uni-koblenz.de (141.26.176.1) at 14:18:77:45:b1:bd [ether] on wlan0`.

```
user@user-pc: Edit View Search Terminal Help
user@user-pc:~$ arp -a
? (192.168.1.1) at b0:48:7a:bb:4f:48 [ether] on wlan0
user@user-pc:~$

user@user-pc: ~
user@user-pc:~$ arp -a
wlanrouter.uni-koblenz.de (141.26.176.1) at 14:18:77:45:b1:bd [ether] on wlan0
user@user-pc:~$
```

**Figure 7:** MAC addresses

## 4 Simple Python Programming (10 Points)

Write a simple python program that does the following:

1. Generate a random number sequence of 10 values between 0 to 90.
2. Perform **sine** and **cosine** operation on numbers generated.
3. Store the values in two different arrays named SIN & COSIN respectively.
4. Plot the values of SIN & COSIN in two different colors.
5. The plot should have labeled axes and legend.

Solution:

see `src/task4.py`
